FUNCTION: This protein is a cell adhesion molecule involved in
neuron-neuron adhesion, neurite fasciculation, outgrowth of
                                neurites, etc.
SUBCELLULAR LOCATION: Attached to the membrane by a GPI-anchor.

Structural and immunological characterization of the amino-terminal domain of mammalian neural cell adhesion molecules.";
J. Biol. Chem. 261:3136-34001 (1986).
- FUNCTION: This protein is a cell adhesion molecule involved in neuron-neuron adhesion, neurite fasciculation, outgrowth of meurines, etc.
- SUBCELLULAR LOCATION: Type I membrane protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NEURAL CELL ADHESION MOLECULE 1, 180 kDa

                                                                                                                                                                                                                                                                                                                                                                             This is PRO1868, a putative homologue of A33 antigen, a known colorectal cancer-associated marker. The invention concerns novel secreted and transmembrane proteins, designated PRO polypeptides. The cDNA and gene sequences are useful in the recombinant production of PRO polypeptides, as a hybridization probe to screen libraries to isolate cDNAs with sequence identity to PRO polypeptides or to map the gene encoding the PRO polypeptides and analyzing genetic disorders. The CDNA/gene can also be used to produce transgenic animals useful for the development and screening of therapeutically useful reagents. They can also be used in gene therapy, e.g. to replace a defective gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     300

                                                                                                                                                               The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodise, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathies, systemic sclerosis, idiopathic inflammatory myopathies, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases of the central and peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, autoimmune or immune-mediated skin diseases, allergic diseases, immunological diseases of the lung, and transplantation associated diseases including graft rejection and graft-versus-host-disease. AAC58397 to AAC58578 represent PCR primers and hybridisation probes used in the isolation of human PRO sequences. AAC58579 to AAC58642 and AAB33477 represent human PRO perseent invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is the human confluency regulated adhesion molecule 1 (CRAM-1, also known as JAM-2). CRAM-1 is one of the vascular adhesion proteins of the immunoglobulin superfamily (Ig Sf). The CRAM-1 protein and coding sequence can be used in the treatment of cancer, inflammation, to modulate cell-cell interactions and angiogenesis, and in the modulation of wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     121 NDRKBIDBIVIBLTVQVKPVTPVCRVPKAVPVGKMATLHCQBSEGHPRPHYSWYRNDVPL 180

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to primers for synthesising full length cDNA clones. 830 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5' and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length methods the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from BPO

for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primars enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length human cDNA of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in CD-ROM format directly from EPO
                                                                                                                                                                                                                                                                                                                                                                                                    SDPRIEWKKIODEOTTYVFPDNKIOGDLAGRAEILGKTSLKIWNVTRRDSALYRCEVVAR

ANUIS172-AAU1246 represent novel human secretory and transmembrane PRO CC polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides. To nothink bioactive molecules to calls expressing PRO CC polypeptides, to link bioactive molecules to calls expressing PRO CC polypeptides, to modulate biological activities of cells expressing PRO CC polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO CC polypeptide expression in a call sample to that in a control sample. Some CC of the 275 sequences are also useful to stimulate the release of tumour confiferation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from cartilage, the release of control of proteoglycans from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells or of T-configurations of propeptides can be used in assays to identify molecules involved in binding interactions. The polymucleotides encoding PRO polypeptides can be used in assays to identify molecules convolved in pinding and can be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Isolated , secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammalian tumors e.g. lung, breast, prostate, cervical.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Deforge L, Desnoyers L, Filvaroff B, G

preparations

The present invention relates to 29 human secreted proteins. The invention is used to prevent autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardiova arrest, cerebrovascular disorders e.g. carebrovassular e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. Also used in food

Claim 11; Page 538-539; 601pp; English.

```

The present invention relates to 29 human secreted proteins. The invention is used to prevent autoimmune diseases e.g. rheumatoid arthritis, hyperproliferative disorders e.g. neoplasms of the breast or liver, cardiovascular disorders e.g. cardioc arrest, cerebrovascular disorders e.g. cerebronia, angiogenesis, nervous system disorders e.g. Alzheimer's disease, infections caused by bacteria, viruses and fungi and ocular disorders e.g. corneal infection. Also used in food

mainto acid sequence identify to secreted and transmembrane polypeptides PRO180, PRO539, PRO982, PRO1434, PRO1863, PRO1917, PRO1868, PRO334 or PRO1800, PRO539, PRO982, PRO1434, PRO1863, PRO1917, PRO1868, PRO3434 or PRO18015, and their encoding mucleic acids. Also included are vectors, host cells and antibodies against PRO polypeptides. PRO proteins are useful for identifying modulators of the polypeptide. PRO1868 useful for the dagnosis and treatment of inflammatory and immune related diseases in including systemic lupus erythematosus, rheumatoid arthritis, systemic solvensis, autoimmune haemolytic amemia, thyroiditis, diabetes mellitus, infectious hepatitis, psoriasis, allergic diseases of the lung and graft-versus host disease and tumours. Pro nucleic acids are useful for constructing hybridisation probes for mapping the gene that encodes that PRO and for the genetic analysis of individuals with genetic disorders, and for generaling transgenic animals which are useful in the development and screening of therapeutically useful reagents. PRO nucleic acids are also useful for gene therapy, chromosome identification, and tissue constructions purposes. The anti-PRO antibodies are useful in electrophoresis purposes. The anti-PRO antibodies are useful in clectrophoresis purposes. The anti-PRO protein service for affinity purification of PRO. The present

polynucleotides, e.g. in therapeutic compositions. They can be used to polynucleotides, e.g. in therapeutic compositions. They can be used to dereen for PRO polypeptide antagonists and agonists useful to identify drug candidates. They can also be used to produce antibodies, useful to detect PRO polypeptides (e.g. diagnostically), purify PRO polypeptides or therapeutically (e.g. as antagonists or to target and/or deliver cyctoxic agents). The polynucleotides are useful therapeutically e.g. to produce antisense sequences to inhibit polypeptide production. They can be used to produce probes and primers useful to detect or isolate sequences encoding PRO polypeptides or similar sequences e.g. variants or sequences from other species. They are also useful for gene mapping and to generate transgenic animals. ABG91355-ABG91363 represent human PRO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    240

ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, antianglogenic, hypotenaive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping, ABL88259 to ABL88257 represent primers and probes used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardiovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PJ, Gurney AL, Hillan KJ, Marsters SA, Pan J, FP, Watanabe CK, Williams PM, Wood WI, Ye W;

The present invention relates to albumin fusion proteins comprising a therapeutic protein X and human albumin (HA, also known as human serum albumin, HSA). The proteins are useful for treating a disease or disorder that may be modulated by therapeutic protein X. The albumin extends the shelf-life of protein X, and may increase its biological in vitro/in vivo activity. The protein is useful for treating and diagnosing disorders such as cancer, reproductive disorders, digestive disorders (e.g. crohn's disease, ulcerative colitis), immune disorders (e.g. acquired immunodeficiency syndrome, AIDS), endocrine disorders (e.g. diabetes), haematopoietic disorders, neural disorders (e.g. Alzheimer's, entzfeldt-Jacob disease, encephalomyelitis, meningitis, echizophrenia), and connective disorders (e.g. osteoporosis, arthritis). ABG63126-ABG65518 represent albumin fusion proteins of the invention
